

REO-PACK MOBILE BALE PACKAGING LINE

The REO-PACK bale wrapper is a fully automatic packaging line specially designed for complete wrapping of bales.

To meet the increasing flexibility requirement for customers with several handling sites, REO-PACK has delivered the first mobile wrapping plant for a customer on the island of Jersey. The task is to load waste bales onto the wrapping line from the rear and unload them using a forklift at the front.

The unit has a transport mode, the machine compresses (narrows) to allow it to be legally transported on public roads.

Trailer sides expanded to wrapping position. Note S3000 swingarm.

STEP 1: Horizontal wrapping in the swingarm stretchwrapper.

STEP 2: Vertical wrapping in the vertical ring stretchwrapper.

The wrapping line is designed to operate in the tough conditions of waste handling. Low maintenance costs with a high level of standard parts were important during the development of the machines.

The machines can be delivered with a painted or galvanized finish.

Every wrapping line is tailor-made to the specific waste bale sizes.
